# MWH'S WATER TREATMENT PRINCIPLES AND DESIGN 3rd Edition 

by Crittenden, Trussell, Hand, Howe, and Tchobanoglous

## HOMEWORK SOLUTION MANUAL

FOR

## Chapter 2 Physical and Chemical Quality of Water

## PROBLEM <br> 2-1

Problem Statement - Given the following test results, determine the mole fraction of calcium ( $\mathrm{Ca}^{2+}$ ).

| Cation | Concentration, <br> mg/L | Anion | Concentration, <br> mg/L |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ca}^{2+}$ | 40.0 | $\mathrm{HCO}_{3}{ }^{-}$ | 91.5 |
| $\mathrm{Mg}^{2+}$ | 12.2 | $\mathrm{SO}_{4}{ }^{2-}$ | 72 |
| $\mathrm{Na}^{+}$ | 15.1 | $\mathrm{Cl}^{-}$ | 22.9 |
| $\mathrm{~K}^{+}$ | 5.1 | $\mathrm{NO}_{3}{ }^{-}$ | 5.0 |

## Solution

1. By definition, using Eq. 2-2, the mole fraction of $\mathrm{Ca}^{2+}$ is as follows.

$$
\mathrm{x}_{\mathrm{Ca}^{2+}}=\frac{\mathrm{n}_{\mathrm{Ca}^{2+}}}{\mathrm{n}_{\mathrm{Ca}^{2+}}+\mathrm{n}_{\mathrm{Mg}^{2+}}+\mathrm{n}_{\mathrm{Na}^{+}}+\mathrm{n}_{\mathrm{K}^{+}}+\mathrm{n}_{\mathrm{HCO}_{3}^{-}}+\mathrm{n}_{\mathrm{SO}_{4}^{2+}}+\mathrm{n}_{\mathrm{Cl}}+\mathrm{n}_{\mathrm{NO}_{3}^{-}}}
$$

2. Substituting in the MW for each of the constituents yields the following:

$$
\begin{aligned}
\mathrm{X}_{\mathrm{Ca}^{2+}} & =\frac{40.08}{40.08+24.31+22.99+39.1+61+96+35.45+62} \\
& =\frac{40.08}{380.93}=0.11
\end{aligned}
$$

## PROBLEM 2-2

Problem Statement - Determine the mole fraction of magnesium $\left(\mathrm{Mg}^{2+}\right)$ for the water given in Problem 2-1.

## Solution

1. By definition, using Eq. 2-2, the mole fraction of $\mathrm{Mg}^{2+}$ is as follows.

$$
\mathrm{X}_{\mathrm{Mg}^{2+}}=\frac{\mathrm{n}_{\mathrm{Mg}^{2+}}}{\mathrm{n}_{\mathrm{Ca}^{2+}}+\mathrm{n}_{\mathrm{Mg}^{2+}}+\mathrm{n}_{\mathrm{Na}^{+}}+\mathrm{n}_{\mathrm{K}^{+}}+\mathrm{n}_{\mathrm{HCO}_{3}^{-}}+\mathrm{n}_{\mathrm{SO}_{4}^{2-}}+\mathrm{n}_{\mathrm{Cl}}+\mathrm{n}_{\mathrm{NO}_{3}^{-}}}
$$

2. Substituting in the MW for each of the constituents yields the following:

$$
\begin{aligned}
\mathrm{x}_{\mathrm{Mg}^{2+}} & =\frac{24.31}{40.08+24.31+22.99+39.1+61+96+35.45+62} \\
& =\frac{24.31}{380.93}=0.06
\end{aligned}
$$

## PROBLEM 2-3

Problem Statement - Determine the mole fraction of sulfate $\left(\mathrm{SO}_{4}{ }^{2-}\right)$ for the water given in Problem 2-1.

## Solution

1. By definition, using Eq. 2-2, the mole fraction of $\mathrm{SO}_{4}^{2-}$ is as follows:

$$
\mathrm{x}_{\mathrm{SO}_{4}^{2 \cdot}}=\frac{\mathrm{n}_{\mathrm{SO}_{4}^{2}}}{\mathrm{n}_{\mathrm{Ca}^{2+}}+\mathrm{n}_{\mathrm{Mg}^{2+}}+\mathrm{n}_{\mathrm{Na}^{+}}+\mathrm{n}_{\mathrm{K}^{+}}+\mathrm{n}_{\mathrm{HCO}_{3}^{-}}+\mathrm{n}_{\mathrm{Cl}}+\mathrm{n}_{\mathrm{NO}_{3}^{-}}}
$$

2. Substituting in the MW for each of the constituents yields the following:

$$
\begin{aligned}
\mathrm{x}_{\mathrm{so}_{4}^{2 .}} & =\frac{96}{40.08+24.31+22.99+39.1+61+96+35.45+62} \\
& =\frac{96}{280.93}=0.25
\end{aligned}
$$

## PROBLEM 2-4

Problem Statement - Commercial-grade sulfuric acid is about 95 percent $\mathrm{H}_{2} \mathrm{SO}_{4}$ by mass. If the specific gravity is 1.85 , determine the molarity, mole fraction, and normality of the sulfuric acid. Use Eq. 2-4 to determine molarity.

$$
\begin{aligned}
& M, \text { mole } / L=\frac{\text { mass of solute, } g}{(\text { molecular weight of solute, } g / \text { mole })(\text { volume of solution, } \mathrm{L})} \\
& M, \text { mole } / \mathrm{L}=\frac{(0.95)(1.85)}{(98)(1)}=0.0179 \text { mole } / \mathrm{L}
\end{aligned}
$$

1. Use Eq. 2-2 to determine the mole fraction.

$$
\begin{aligned}
\mathrm{X}_{\mathrm{H}_{2} \mathrm{SO}_{4}} & =\frac{\mathrm{n}_{\mathrm{H}_{2} \mathrm{SO}_{4}}}{\mathrm{n}_{\mathrm{H}_{2} \mathrm{O}}+\mathrm{n}_{\mathrm{H}_{2} \mathrm{SO}_{4}}} \\
& =\frac{98}{18+98}=0.84
\end{aligned}
$$

2. Use Eq. 2-6 to determine the normality.
$N, e q / L=\frac{\text { mass of solute, } g}{(\text { equivalent weight of solute, } g / e q)(\text { volume of solution, } L)}$
$N, e q / L=\frac{(0.95)(1.85)}{(49)(1)}=0.036 \mathrm{eq} / \mathrm{L}$

## PROBLEM 2-5

Problem Statement - If the UV intensity measured at the surface of a water sample is $180 \mathrm{~mW} / \mathrm{cm}^{2}$, estimate the average intensity in a petri dish with an average depth of 15 mm (used to study the inactivation of microorganisms after exposure to UV light, as discussed in Chap. 13). Assume the absorptivity of the water, $k_{A}(\lambda)$ at $\lambda=$ 254 nm , is $0.10 \mathrm{~cm}^{-1}$ and that the following form of the Beer-Lambert law applies:

$$
\ln \left(\frac{\mathrm{I}}{\mathrm{I}_{0}}\right)=-2.303 \mathrm{k}_{\mathrm{A}}(\lambda) \mathrm{x}
$$

## Solution

1. The variables for the Beer-Lambert law are the following:

I = unknown
$\mathrm{I}_{0}=180 \mathrm{~mJ} / \mathrm{cm} 2$
$\mathrm{k}_{\mathrm{A}}(\lambda)=0.10 / \mathrm{cm}$
$x=1.5 \mathrm{~cm}$
2. Rearrange the Beer-Lambert law given in the problem statement to solve for I as follows:
$\mathrm{I}=\mathrm{I}_{0} \mathrm{e}^{-2.303 \mathrm{k} \lambda(x)}$
$\mathrm{I}=280 \mathrm{e}^{-2.303(0.10)(1.5)}$
$\mathrm{I}=174 \mathrm{~mJ} / \mathrm{cm}^{2}$

## PROBLEM 2-6

Problem Statement - If the average UV intensity in a Petri dish containing water at a depth of 10 mm is $120 \mathrm{~mW} / \mathrm{cm}^{2}$, what is the UV intensity at the surface of the water sample? Assume the absorptivity of the water, $k_{A}(\lambda)$ at $\lambda=254 \mathrm{~nm}$, is $0.125 \mathrm{~cm}^{-1}$ and that the equation given in Problem 2-5 applies.

## Solution

1. The variables for the Beer-Lambert law are the following:
$\mathrm{I}=120 \mathrm{~mJ} / \mathrm{cm}^{2}$
$\mathrm{I}_{0}=$ unknown
$\mathrm{k}_{\mathrm{A}}(\lambda)=0.125 / \mathrm{cm}$
$x=1.0 \mathrm{~cm}$
2. Rearrange the Beer-Lambert law given in the problem statement to solve for $I_{0}$ as follows:
$I_{0}=\frac{1}{e^{-2.303 k \lambda(x)}}$
$\mathrm{I}_{0}=\frac{120}{\mathrm{e}^{-2.303(0.125)(1.0)}}=160 \mathrm{~mJ} / \mathrm{cm}^{2}$

## PROBLEM <br> 2-7

Problem Statement - If the transmittance is 92 percent and a photo cell with a 12-mm path length was used, what is the absorptivity?

## Solution

1. Set up Eq. 2-12 to solve for $T$ in terms of the variables which are given in the problem statement; $-\mathrm{k}_{\mathrm{A}}(\lambda)$, and x .
a. From Eq. 2-10, $=-A(\lambda)$
b. $\mathrm{T}, \%=10^{-\mathrm{kA}(\lambda) \mathrm{x}} \times 100$
c. Variables for this equation are the following:

$$
\begin{aligned}
& \mathrm{T}, \%=92 \\
& -\mathrm{k}_{\mathrm{A}}(\lambda)=\text { unknown }
\end{aligned}
$$

$$
x=1.2 \mathrm{~cm}
$$

2. Rearrange Eq. 2-12 to solve for absorptivity, $k_{A}(\lambda)$, as follows:

$$
\begin{aligned}
-k \lambda_{A}() & =\frac{\log \left(\frac{T}{100}\right)}{x} \\
& =\frac{\log \left(\frac{92}{100}\right)}{1.2}=-0.030 \\
k \lambda_{A}() 0 & =030 \mathrm{~cm}^{-1}
\end{aligned}
$$

## PROBLEM <br> 2-8

Problem Statement - Given the following data obtained on two water supply sources, determine the constants in Eq. 2-16 and estimate the number of particles in the size range between 2.1 and 5 . Also, comment on the nature of the particle size distributions.

|  | Particle Count |  |
| :---: | :---: | :---: |
| Bin Size, mm | Water A | Water B |
| $5.1-10$ | 2500 | 110 |
| $10.1-15$ | 850 | 80 |
| $15.1-20$ | 500 | 55 |
| $20.1-30$ | 250 | 36 |
| $30.1-40$ | 80 | 25 |
| $40.1-50$ | 60 | 20 |
| $50.1-75$ | 28 | 15 |
| $75.1-100$ | 10 | 10 |

## Solution

1. Calculate the information necessary to graphically represent the data. This information is shown in the following table.

|  | Geometric mean | Water A particle | Water B particle |
| :---: | :---: | :---: | :---: |
| Bin size, mm | diameter, $\left(\mathrm{d}_{\mathrm{p}}\right)_{\mathrm{g}}$ | number | number |

| $5.1-10$ | $7.14^{\mathrm{a}}$ | 2500 | 110 |
| :--- | :--- | :--- | :--- |
| $10.1-15$ | 12.31 | 850 | 80 |
| $15.1-20$ | 17.38 | 500 | 55 |
| $20.1-30$ | 24.56 | 250 | 36 |
| $30.1-40$ | 34.70 | 80 | 25 |
| $40.1-50$ | 44.78 | 60 | 20 |
| $50.1-75$ | 61.30 | 28 | 15 |
| $75.1-100$ | 86.66 | 10 | 10 |

a $7.14=\sqrt{5.1 \times 10}$
2. Prepare a plot of the geometric mean diameter for the bin size, $\left(d_{p}\right)_{g}$, versus the number of particles in the corresponding bin size.

3. Determine $A$ and $\beta$ using Eq. 9-4 and the data plot from step 2.

The value of $A$ is determined when $d_{p}=1 \mu \mathrm{~m}$ for the best-fit regression line through the data, along with $\beta$, which is the power law slope coefficient.
a. Water A

The equation for the data regression line is shown on the graph in step 2, and the values for $A$ and $\beta$ are:
$A=222492$ and $\beta=2.1953$
b. Water B

The equation for the data regression line is shown on the graph in step 2, and the values for $A$ and $\beta$ are:
$A=864.89$ and $\beta=0.9903$
4. Estimate the number of particles in the size range between 2.1 and 5 .
a. Calculate the geometric mean size.
$\sqrt{2.1 \times 5}=3.24$
b. Estimate the number of particles in water $A$ using the equation for the data regression line determined in step 2.

$$
n(3.24)=222492 \times 3.24^{-2.1953}=16,842
$$

c. Estimate the number of particles in water B using the equation for the data regression line determined in step 2.
$\mathrm{n}(3.24)=864.89 \times 3.24^{-0.9903}=270$
5. Comment on the nature of the particle size distributions.

Parameter $A$ is much greater for water $A$ than for water $B$. As the value of $A$ increases, the total number of particles in each size classification increases, thus, the total number of particles in water $A$ in each size classification is greater than in water $B$.

The slope $\beta$ is a measure of the relative number of particles in each size range. Thus, if $\beta$ is less than one 1 , the particle size distribution is dominated by large particles, if $\beta$ is equal to one all particle sizes are represented equally, and if $\beta$ is greater the one the particle size distribution is dominated by small particles. The particle size distribution is dominated by small particles for water A because $\beta$ (2.1953) is greater than one. All particle sizes are represented nearly equally for water $B$ because $\beta(0.9903)$ is close to one.

## PROBLEM <br> 2-9

Problem Statement - The following particle size data were data obtained for the influent and effluent from a granular medium filter. Determine the constants in Eq. 2-16 and assess the effect of the filter in removing particles.

|  | Particle Count |  |
| :---: | :---: | :---: |
| Bin Size, mm | Influent | Effluent |
| $2.51-5$ | 20000 | 101 |
| $5.1-10$ | 8000 | 32 |
| $10.1-20$ | 2000 | 6 |
| $20.1-40$ | 800 | 3.2 |
| $40.1-80$ | 400 | 1.2 |
| $80.1-160$ | 85 | 0.34 |
| $160.1-320$ | 40 | 0.12 |

## Solution

1. Calculate the information necessary to graphically represent the data. This information is shown in the following table.

|  | Geometric mean <br> diameter, $\left(d_{p}\right) \mathrm{g}$ | Influent particle <br> number | Effluent particle <br> number |
| :--- | :---: | :---: | :---: |
| $2.51-5$ | $3.54^{\mathrm{a}}$ | 20000 | 101 |
| $5.1-10$ | 7.14 | 8000 | 32 |
| $10.1-20$ | 14.21 | 2000 | 6 |
| $20.1-40$ | 28.35 | 800 | 3.2 |
| $40.1-80$ | 56.64 | 400 | 1.2 |
| $80.1-160$ | 113.21 | 85 | 0.34 |
| $160.1-320$ | 226.34 | 40 | 0.12 |

a $3.54=\sqrt{2.51 \times 5}$
2. Prepare a plot of the geometric mean diameter for the bin size, $\left(d_{p}\right)_{g}$, versus the number of particles in the corresponding bin size.

3. Determine $A$ and $\beta$ :
a. Influent

The equation for the data regression line is shown on the graph in step 2, and the values for $A$ and $\beta$ are:
$A=136189$ and $\beta=1.514$
b. Effluent

The equation for the data regression line is shown on the graph in step 2, and the values for $A$ and $\beta$ are:
$A=652.15$ and $\beta=1.595$
4. Assess the effect of the filter in removing particles.
a. Parameter $A$ is much greater for the influent than it is for the effluent.

Therefore, the effluent contains fewer particles than the influent, meaning the filter successfully removed many particles.
b. Both the influent and the effluent are dominated by small particles because $\beta$ ( 1.514 for influent and 1.595 for effluent) is greater than one. The filter is effective in removing all sizes of particles because $\beta$ for the effluent is close to the value for the influent.

## PROBLEM <br> 2-10

Problem Statement - Determine the alkalinity and hardness in milligrams per liter as $\mathrm{CaCO}_{3}$ for the water sample in Problem 2-1.

## Solution

1. Determine alkalinity.
a. Use Eq. 2-26 and determine the alkalinity in milliequivalents per liter.

Alk, meq/L $=\left(\mathrm{HCO}_{3}{ }^{-}\right)+\left(\mathrm{CO}_{3}{ }^{2-}\right)+\left(\mathrm{OH}^{-}\right)-\left(\mathrm{H}^{+}\right)$

| Alkalinity ions | Conc., $\mathrm{mg} / \mathrm{L}$ | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{HCO}_{3}{ }^{-}$ | 91.5 | 61.02 | 1.50 |

a Molecular weight/Z (see Eq. 2-7)
b. Adding the conversion from $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ (see page xxx of the text) with Eq. 2-26 yields the following:

Alkalinity as $\mathrm{CaCO}_{3}=\mathrm{meq} / \mathrm{L}$ of substance $\times \mathrm{meq} / \mathrm{L}$ mass of $\mathrm{CaCO}_{3}, 50 \mathrm{mg} / \mathrm{meq}$ Alk $=(1.50)(50)=75 \mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$
2. Determine hardness.
a. Use Eq. 2-23 and determine the hardness in milliequivalents per liter.

Hardness, meq/I = $\left(\mathrm{Ca}^{+2}\right)+\left(\mathrm{Mg}^{+2}\right)$

| Hardness ions | Conc., mg/L | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{Ca}^{2+}$ | 40 | $20.04^{\mathrm{b}}$ | 2.00 |
| $\mathrm{Mg}^{2+}$ | 12.2 | 12.15 | 1.00 |
|  |  | $\sum$ hardness ions | 3.00 |

a Molecular weight/Z (see Eq. 2-8)
b. Adding the conversion from $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ (see page xxx of the text) with Eq. 2-23 yields the following:
$\begin{aligned} & \text { Hardness } \\ & \text { as } \mathrm{CaCO}_{3}\end{aligned}=\mathrm{meq} / \mathrm{L}$ of substance $\times \mathrm{meq} / \mathrm{L}$ mass of $\mathrm{CaCO}_{3}, 50 \mathrm{mg} / \mathrm{meq}$
Hardness $=(3)(50)=150 \mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$

## PROBLEM <br> 2-11

Problem Statement - Given the following incomplete water analysis, determine the unknown values if the alkalinity and noncarbonate hardness are 50 and $150 \mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$, respectively:

| Ion | Concentration, <br> mg/L |
| :---: | :---: |
| $\mathrm{Ca}^{2+}$ | 42.0 |
| $\mathrm{Mg}^{2+}$ | $?$ |
| $\mathrm{Na}^{+}$ | $?$ |
| $\mathrm{~K}^{+}$ | 29.5 |
| $\mathrm{HCO}_{3}^{-}$ | $?$ |
| $\mathrm{SO}_{4}{ }^{2-}$ | 96.0 |
| $\mathrm{Cl}^{-}$ | 35.5 |
| $\mathrm{NO}_{3}^{-}$ | 4.0 |

## Solution

1. Determine the concentration of $\mathrm{HCO}_{3}$ - using Eq. 2-26.

Alk, meq/L $=\left(\mathrm{HCO}_{3}-\right)+\left(\mathrm{CO}_{3}^{2-}\right)+\left(\mathrm{OH}^{-}\right)-\left(\mathrm{H}^{+}\right)$
a. Convert alkalinity from $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ to $\mathrm{meq} / \mathrm{L}$.
$\mathrm{mg} / \mathrm{L}$ alkalinity as $\mathrm{CaCO}_{3}$ :
$=\mathrm{meq} / \mathrm{L}$ of alkalinity ions $\times \mathrm{meq} / \mathrm{L}$ mass of $\mathrm{CaCO}_{3}, 50 \mathrm{mg} / \mathrm{meq}$

$\mathrm{meq} / \mathrm{L}$ of alkalinity ions $=\frac{50 \mathrm{mg} / \mathrm{L}}{50 \mathrm{mg} / \mathrm{meq}}=1 \mathrm{meq} / \mathrm{L}$
b. Use Eq. 2-26 to determine the alkalinity ions that are present in the water analysis. The only alkalinity ion listed in the water analysis is $\mathrm{HCO}_{3}^{-}$, which is unknown.
c. Convert the concentration of $\mathrm{HCO}_{3}^{-}$in $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as follows:
Alkalinity ions Conc., mg/L mg/meq ${ }^{\mathrm{a}} \mathrm{meq} / \mathrm{L}$

| $\mathrm{HCO}_{3}{ }^{-}$ | 61.02 | 61.02 | 1.00 |
| :---: | :---: | :---: | :---: |

a Molecular weight/Z (see Eq. 2-7)
2. Determine the value of $\mathrm{Mg}^{2+}$ using Eq. 2-23. (Non-carbonate hardness is the concentration of $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$ associated with nonalkalinity anions such as $\mathrm{Cl}^{-}$ and $\mathrm{SO}_{4}{ }^{2-}$. In this problem, $1.0 \mathrm{meq} / \mathrm{L}$ of $\mathrm{Ca}^{2+}$ are associated with $\mathrm{HCO}_{3}{ }^{-}$an alkalinity anion. The remaining concentration of $\mathrm{Ca}^{2+}, 1.1 \mathrm{meq} / \mathrm{L}$ and all of the $\mathrm{Mg}^{2+}$ are associated with $\mathrm{SO}_{4}{ }^{2-}$ and $\mathrm{Cl}^{-}$, both nonalkalinity anions.)
a. Convert hardness from $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ to $\mathrm{meq} / \mathrm{L}$.
$\begin{aligned} & \mathrm{mg} / \mathrm{L} \text { hardness } \\ & \text { as } \mathrm{CaCO}_{3}\end{aligned}=\mathrm{meq} / \mathrm{L}$ of hardness ions $\times \mathrm{meq} / \mathrm{L}$ mass of $\mathrm{CaCO}_{3}, 50 \mathrm{mg} / \mathrm{meq}$
$\mathrm{meq} / \mathrm{L}$ of hardness ions $=\frac{\mathrm{mg} / \mathrm{L} \text { hardness as } \mathrm{CaCO}_{3}}{\mathrm{meq} / \mathrm{L} \text { mass of } \mathrm{CaCO}_{3}}$
$\mathrm{meq} / \mathrm{L}$ of hardness ions $=\frac{150 \mathrm{mg} / \mathrm{L}}{50 \mathrm{mg} / \mathrm{meq}}=3 \mathrm{meq} / \mathrm{L}$
b. Use Eq. 2-23 and determine the hardness ions that are present in the water analysis.
Hardness, $\mathrm{meq} / \mathrm{l}=\left(\mathrm{Ca}^{2+}\right)+\left(\mathrm{Mg}^{2+}\right)$
The ions listed in the water analysis are $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$; the concentration of $\mathrm{Mg}^{2+}$ unknown.
c. Determine the concentration of $\mathrm{Mg}^{2+}$ and convert the concentration of $\mathrm{Mg}^{2+}$ in $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as follows:

| Hardness ions | Conc., $\mathrm{mg} / \mathrm{L}$ |  | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ |
| :--- | :---: | :---: | :---: | :---: |
| $\mathrm{Ca}^{2+}$ | 42.0 | $20.04^{\mathrm{b}}$ | 2.1 |  |
| $\mathrm{Mg}^{2+}$ | 10.94 | 12.15 | 0.9 |  |
|  |  |  | $\sum$ hardness ions | 3.0 |

> a Molecular weight/Z (see Eq. 2-8)
3. Determine the concentration of $\mathrm{Na}^{+}$from an anion, cation balance.
a. Prepare a cation-anion balance.

|  | Conc., |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Cation | $\mathrm{mg} / \mathrm{L}$ | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ | Anion | $\mathrm{mg} / \mathrm{L}$ | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ |  |

| $\mathrm{Ca}^{2+}$ | 42.0 | $20.04^{\mathrm{b}}$ | 2.1 | $\mathrm{HCO}_{3}{ }^{-}$ | 61.02 | 61.02 | 1.00 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Mg}^{2+}$ | 10.94 | 12.15 | 0.9 | $\mathrm{SO}_{4}{ }^{2-}$ | 96.0 | 48.03 | 2.00 |
| $\mathrm{Na}^{+}$ |  | 23 |  | $\mathrm{Cl}^{-}$ | 35.5 | 35.45 | 1.00 |
| $\mathrm{~K}^{+}$ | 29.5 | 39.1 | 0.75 | $\mathrm{NO}_{3}{ }^{-}$ | 4.0 | 62.01 | 0.06 |
| $\sum$ cations |  |  |  |  |  |  |  |

a Molecular weight/Z (see Eq. 2-7)
b For calcium, equivalent weight $=40.08 / 2=20.04 \mathrm{~g} / \mathrm{eq}$ or $20.04 \mathrm{mg} / \mathrm{meq}$
b. Calculate the concentration of $\mathrm{Na}+$ from the difference between the sum of the cations and the sum of the anions.
$\mathrm{Na}^{+} \mathrm{meq} / \mathrm{L}=\sum$ anions $-\sum$ cations
$\mathrm{Na}^{+} \mathrm{meq} / \mathrm{L}=4.06-3.75=0.31$
$\mathrm{Na}^{+} \mathrm{mg} / \mathrm{L}=\mathrm{Na}^{+} \mathrm{mg} / \mathrm{meq} \times \mathrm{Na}^{+} \mathrm{meq} / \mathrm{L}$
$\mathrm{Na}^{+} \mathrm{mg} / \mathrm{L}=(23)(0.31)=7.13 \mathrm{mg} / \mathrm{L}$

## PROBLEM 2-12

Instructors Note: See Chap. 19 for a more thorough discussion of hardness, where total, carbonate, and non-carbonate hardness are explained.

Problem Statement - Given the following incomplete water analysis measured at $25^{\circ} \mathrm{C}$, determine the unknown values if the alkalinity and noncarbonate hardness are 40 and $180 \mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ :

| Ion | Concentration, mg/L |
| :---: | :---: |
| $\mathrm{Ca}^{2+}$ | 55.0 |
| $\mathrm{Mg}^{2+}$ | $?$ |
| $\mathrm{Na}^{+}$ | 23.0 |
| $\mathrm{~K}^{+}$ | $?$ |
| $\mathrm{HCO}_{3}^{-}$ | $?$ |
| $\mathrm{SO}_{4}^{2-}$ | 48.0 |
| $\mathrm{Cl}^{-}$ | $?$ |
| $\mathrm{CO}_{2}$ | 4.0 |

## Solution

1. Determine the concentration of $\mathrm{HCO}_{3}^{-}$using Eq. 2-26.
a. Convert alkalinity from $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ to $\mathrm{meq} / \mathrm{L}$.
$\mathrm{mg} / \mathrm{L}$ alkalinity
as $\mathrm{CaCO}_{3}=\mathrm{meq} / \mathrm{L}$ of alkalinity ions $\times \mathrm{meq} / \mathrm{L}$ mass of $\mathrm{CaCO}_{3}, 50 \mathrm{mg} / \mathrm{meq}$
$\mathrm{meq} / \mathrm{L}$ of alkalinity ions $=\frac{\mathrm{mg} / \mathrm{L} \text { alkalinity as } \mathrm{CaCO}_{3}}{\mathrm{meq} / \mathrm{L} \text { mass of } \mathrm{CaCO}_{3}}$
$\mathrm{meq} / \mathrm{L}$ of alkalinity ions $=\frac{40 \mathrm{mg} / \mathrm{L}}{50 \mathrm{mg} / \mathrm{meq}}=0.8 \mathrm{meq} / \mathrm{L}$
b. Use Eq. 2-26 and determine the alkalinity ions that are present in the water analysis.

Alk, meq/L $=\left(\mathrm{HCO}_{3}^{-}\right)+\left(\mathrm{CO}_{3}^{2-}\right)+\left(\mathrm{OH}^{-}\right)-\left(\mathrm{H}^{+}\right)$
The only alkalinity ion listed in the water analysis is $\mathrm{HCO}_{3}^{-}$, which is unknown.
c. Convert the concentration of $\mathrm{HCO}_{3}^{-}$in $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as follows:

| Alkalinity ions | Conc., $\mathrm{mg} / \mathrm{L}$ | $\mathrm{mg} / \mathrm{meq}^{\mathrm{a}}$ | $\mathrm{meq} / \mathrm{L}$ |
| :---: | :---: | ---: | :---: |
| $\mathrm{HCO}_{3}{ }^{-}$ | 48.82 | 61.02 | 0.80 |

a Molecular weight/Z (see Eq. 2-8)
2. Determine the value of $\mathrm{Mg}^{2+}$ using Eq. 2-23, which is for non-carbonate hardness.
a. Convert hardness from $\mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ to $\mathrm{meq} / \mathrm{L}$.
$\mathrm{mg} / \mathrm{L}$ hardness as $\mathrm{CaCO}_{3}$
$\mathrm{meq} / \mathrm{L}$ of hardness ions $=\frac{\mathrm{mg} / \mathrm{L} \text { hardness as } \mathrm{CaCO}_{3}}{\mathrm{meq} / \mathrm{L} \text { mass of } \mathrm{CaCO}_{3}}$
$\mathrm{meq} / \mathrm{L}$ of hardness ions $=\frac{180 \mathrm{mg} / \mathrm{L}}{50 \mathrm{mg} / \mathrm{meq}}=3.6 \mathrm{meq} / \mathrm{L}$
b. Use Eq. 2-23 and determine the hardness ions that are present in the water analysis.
Hardness, meq/l $=\left(\mathrm{Ca}^{2+}\right)+\left(\mathrm{Mg}^{2+}\right)$
The hardness ions listed in the water analysis are $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$, and the concentration of $\mathrm{Mg}^{2+}$ is unknown.
c. Determine the concentration of $\mathrm{Mg}^{2+}$ and convert the concentration of $\mathrm{Mg}^{2+}$ in $\mathrm{meq} / \mathrm{L}$ to $\mathrm{mg} / \mathrm{L}$ as follows:

| Hardness ions | Conc., mg/L | $\mathrm{mg} / \mathrm{meq}^{\text {a }}$ | meq/L |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ca}^{2+}$ | 55.0 | $20.04{ }^{\text {b }}$ | 2.74 |
| Mg ${ }^{2+}$ | 10.45 | 12.15 | 0.86 |
| $\sum$ hardness ions 3.6 |  |  |  |

a Molecular weight/Z (see Eq. 2-7)

## PROBLEM 2-13

Problem Statement - Review the current literature and cite three articles in which the SUVA (specific UV absorbance) measurements were made. Prepare a summary table of the reported values. Can any conclusions be drawn from the data in the summary table you have prepared?

## Solution

Answers will vary depending on the articles reviewed. References for several potential articles related to measurement of SUVA are provided below:

Karanfil, T., Schlautman, M. A. and Erdogan, I. (2002) Survey of DOC and UV Measurement Practices with Implications for SUVA Determination, J. AWWA, 94, 12, 68-80.

Weishaar, J. L., Aiken, G. R., Bergamaschi, B. A., Fram, M. S., Fujii, R. and Mopper, K. (2003) Evaluation of Specific Ultraviolet Absorbance as an Indicator of the Chemical Composition and Reactivity of Dissolved Organic Carbon, Environ. Sci. Technol., 37, 20, 4702-4708.

Aqueous Chlorine and Bromine, Water Res., 38, 6, 1502-1513.

## PROBLEM 2-14

Problem Statement - Review the current literature and prepare a brief synopsis of two articles in which the DOM (dissolved organic matter) was measured. What if any conclusions can be drawn from these articles about the utility of DOM measurements.

## Solution

Answers will vary depending on the articles reviewed. References for several potential articles related to the measurement and utility of DOM are provided below:

Afcharian, A., Levi, Y., Kiene, L. and Scribe, P. (1997) Fractionation of Dissolved Organic Matter from Surface Waters using Macroporous Resins, Water Res., 31, 12, 2989-2996.

## PROBLEM 2-15

Problem Statement - Determine the concentration in $\mu \mathrm{g} / \mathrm{m}^{3}$ of $10 \mathrm{ppm}_{\mathrm{v}}$ (by volume) of trichloroethylene (TCE) $\left(\mathrm{C}_{2} \mathrm{HCl}_{3}\right)$ at standard conditions ( $0^{\circ} \mathrm{C}$ and 1 atm).

## Solution

Use Eq. 2-29 to solve for concentration of TCE $\left(\mathrm{C}_{2} \mathrm{HCl}_{3}\right)$.

1. Determine the variables for Eq. 2-29
$\mathrm{ppm}_{\mathrm{v}}=10$
$m w=2(12.01)+1+3(35.45)=131.37$
concentration, $\mu \mathrm{g} / \mathrm{m}^{3}=$ unknown
2. Solve for concentration using Eq. 2-29.
$\mu \mathrm{g} / \mathrm{m}^{3}=\frac{\left(\text { concentration, } \mathrm{ppm}_{\mathrm{v}}\right)(\mathrm{mw}, \mathrm{g} / \text { mole of gas })\left(10^{6} \mu \mathrm{~g} / \mathrm{g}\right)}{\left(22.141 \times 10^{-3} \mathrm{~m}^{3} / \text { mole of gas }\right)}$
concentration, $\mu \mathrm{g} / \mathrm{m}^{3}=\frac{\left(\frac{10 \mathrm{~m}^{3}}{10^{6} \mathrm{~m}^{3}}\right)(131.37 \mathrm{~g} / \mathrm{mole})(10 \mathrm{~g} / \mathrm{g} \quad)}{22.141 \times 10^{-3} \mathrm{~m}^{3} / \mathrm{mole} \text { gas }}$
concentration, $\mu \mathrm{g} / \mathrm{m}^{3}=5.93 \times 10^{3}$

## PROBLEM 2-16

Problem Statement - If the concentration of TCE at standard conditions ( $0^{\circ} \mathrm{C}$ and 1 atm ) is $15 \mu \mathrm{~g} / \mathrm{m}^{3}$, what is the corresponding concentration in $\mathrm{ppm}_{\mathrm{v}}$ (by volume)?

## Solution

Use Eq. 2-29 to solve for concentration of TCE $\left(\mathrm{C}_{2} \mathrm{HCl}_{3}\right)$.

1. Determine the variables for Eq. 2-40
$\mathrm{ppm}_{\mathrm{v}}=$ unknown
$m w=2(12.01)+1+3(35.45)=131.37$
concentration, $\mu \mathrm{g} / \mathrm{m}^{3}=15 \mu \mathrm{~g} / \mathrm{m}^{3}$
2. Rearrange Eq. 2-29 and solve for $\mathrm{ppm}_{\mathrm{v}}$ as
conc. $\mu \mathrm{g} / \mathrm{m}^{3}=\frac{\left(\text { conc. } \mathrm{ppm}_{\mathrm{v}}\right)\left(\mathrm{mw}, \mathrm{g} / \mathrm{mole} \mathrm{of} \mathrm{gas} \mu_{\mathrm{m}}^{\mathrm{g}} \mathrm{g} / \mathrm{g}^{6}{ }^{6}\right)}{22.141 \times 10^{-3} \mathrm{~m}^{3} / \mathrm{mole} \text { of gas }}$
follows: conc. $\mathrm{ppm}_{\mathrm{v}}=\frac{\left(\text { conc. } \mu \mathrm{g} / \mathrm{m}^{3}\right)\left(22.141 \times 10^{-3} \mathrm{~m}^{3} / \mathrm{mole} \text { of gas }\right)\left(1 \mathrm{~m}^{3} / 10^{6} \mathrm{~m}^{3}\right)}{(\mathrm{mw}, \mathrm{g} / \mathrm{mole} \text { of gas })(10 \mathrm{~g} / \mathrm{g})}$
conc. $\mathrm{ppm}_{\mathrm{v}}=\frac{\left(15 \mu \mathrm{~g} / \mathrm{m}^{3}\right)\left(22.141 \times 10^{-3} \mathrm{~m}^{3} / \mathrm{mole} \text { of gas }\right)\left(1 \mathrm{~m}^{3} / 10^{6} \mathrm{~m}^{3}\right)}{(131.37 \mathrm{~g} / \text { mole of gas })(10 \hat{\mathrm{~g}} / \mathrm{g})}$
conc. $\mathrm{ppm}_{\mathrm{v}}=1.685 \times 10^{-4}$
